

Whatman Puradisc 25 mm H-PTFE Syringe Filters

Product Information Sheet

Introduction

Important

Read these instructions carefully before using the products.

Intended use

The products are intended for research use only, and shall not be used in any clinical or *in vitro* procedures for diagnostic purposes.

Safety

For use and handling of the products in a safe way, either refer to the Safety section in these instructions or to the Safety Data Sheets where applicable.

Description

Puradisc 25 mm H-PTFE Syringe Filters have been designed to provide pure filtration of solvents, chemicals, aqueous, and non-aqueous solutions and samples. They consist of a hydrophilic polytetrafluoroethylene (H-PTFE) membrane with a polypropylene (PP) housing.

Disposable filtration devices provide great labor saving efficiency while ensuring consistent filtration when compared to hand assembled filter housings.

This document provides general information on Puradisc 25 mm H-PTFE Syringe Filters. The specifications in the Technical Data section are intended to provide the basis for establishing functional use, as well as setting quality assurance test performance levels.

- Hydrophilic PTFE membrane
- Solvent Resistant Membrane
- Polypropylene Housing
- Rugged Construction
- Autoclavable
- Two Pore Sizes Available
- Inlet: Female Luer Lock (FLL)
Outlet: Male Slip Luer (ML)
- Integrity Testable BP or WBT ('in-situ')

Hydrophilic Polytetrafluoroethylene (H-PTFE) Membrane

Hydrophilic Polytetrafluoroethylene membrane can be used for both aqueous and aggressive organic solvents. This membrane is suitable for uHPLC / HPLC sample preparation as well as many other applications in a busy, high volume lab as its dual capability handles most solvents.

Typical applications for Puradisc 25 mm H-PTFE Syringe Filters

HPLC, TLC and GC Sample Clarification
HPLC Solvent Filtration

Technical Data: Puradisc 25 mm H-PTFE Syringe Filters

Connectors:	Inlet - Female Luer Lock (FLL) Outlet - Male Slip Luer (ML)
Weight:	Approximately 2.7 grams
Filtration Area:	Approximately 4.2 cm ²
Maximum Pressure:	5.2 bar (75 psi)
Housing:	Polypropylene (PP)
Filter Media:	Hydrophilic Polytetrafluoroethylene (H-PTFE)
Hold-Up Volume:	Full housing 0.16 mL with air purge < 0.1 mL
Flow Direction:	Flow should enter from the inlet
Sterilization:	Autoclave at 121°C (131°C max) for 20 minutes

Operating Instructions

Safety: When considering the special factors of your application, consult the Technical Data to determine correctness of use. Do not exceed the pressure, temperature, or chemical compatibility recommendations. High pressures can be obtained when using syringes. The smaller the syringe the higher the pressure that can be generated. As a general guide, the following pressures can be

obtained by hand with the syringes indicated: 20 mL, 80 psi; 10 mL, 140 psi; 5 mL, 180 psi; 3 mL, 200 psi; 1 mL, 250 psi. Each user should determine the pressure they can generate by hand with a specific size syringe and take appropriate safety precautions not to exceed the recommended rating for the device used.

CAUTION

If these limitations are exceeded, bursting of the device may occur resulting in loss of sample or personal injury.

Efficiency: To maximise filtration throughput, use the largest pore size filter that will provide the required cleanliness. To extend filter life use low flow rates or pressures.

To use with a Syringe:

Step Action

- 1 Fill the syringe with the solution to be filtered.
- 2 Secure the filled syringe to the FLL inlet of the syringe filter with a twisting motion.
- 3 With the outlet pointed upward, gradually apply thumb pressure to the syringe plunger to initiate flow.
- 4 Continue thumb pressure until all the air in the device is displaced with liquid.
- 5 Once liquid starts to exit the syringe filter from the outlet, stop applying pressure, point device downward and away from user.
- 6 Orientate syringe filter over suitable collection container or other apparatus and apply pressure again to filter sample.

Air Lock: Seriously hamper flow rates. To eliminate, point the outlet of the filter device upward during the initiation of liquid flow.

Bubble Point (BP) Test: Flush the filter device with 1.0 mL or more of the test fluid. After the filter is completely wet, with the outlet pointed upward, apply air under controlled pressure to the inlet until air breaks through the filter and bubbles can be seen at the outlet. The pressure at which air passes through the wetted filter is the BP. Refer to table for typical BP values.

Integrity Test Data

Bubble Point determined with Water.

Water Breakthrough Test is a Pressure Hold Test. Hold the rated pressure for 15 seconds. To remove test water, shake or use vacuum. Sterile water is recommended for "in-situ" testing of critical applications.

Description	Pore Size (µm)	Minimum Bubble Point (psi)	Water Breakthrough (psi)
H-PTFE	0.2	49	N/A
H-PTFE	0.45	28	N/A
